

I urge the FCC to reject this internet-over-powerline technology.

Internet access over power lines is going to be an interference nightmare for amateur radio operators, internet users, and the FCC. The RF emanations from these powerline devices are going to be a severe hindrance to amateur radio operators' reception, and the 1500 watt amateur transmitters will undoubtedly wreak havoc with the performance of the internet devices.

If the use of this technology is approved, the FCC is going to be swamped with complaints from amateurs, and from the internet users.
